Depending on their duties, Police Officers (Officers) may be exposed to blood or body fluids in the course of their work. This means Officers have an occupational risk of contact with blood-borne viruses.

The Facts

The three major BBVs – hepatitis B (HBV), hepatitis C (HCV) and human immunodeficiency virus (HIV) – are different viruses, but they are all spread by blood. Hepatitis B and HIV can also be passed on in other body fluids. 

All these infections can be prevented.

They can all be treated, but if left untreated, in some people, they may lead to serious health problems. See Table 1 for The Facts About hepatitis B, hepatitis C, and HIV.
# Table 1: The Facts About hepatitis B, hepatitis C and HIV

<table>
<thead>

<th>Hepatitis B</th>
<th>Hepatitis C</th>
<th>HIV</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Prevalence</strong></td>
<td>An estimated 210 000 people in Australia living with chronic HBV at the end of 2013. (less than 1% of the population)</td>
<td>An estimated 230 000 people in Australia were living with chronic HCV at the end of 2013. (about 1% of the population)</td>
<td>At the end of 2013, an estimated 26800 people in Australia were living with HIV infection. (about 0.1% of the population)</td>
</tr>
<tr>
<td><strong>Vaccination/Immunity</strong></td>
<td>HBV can be prevented by vaccination</td>
<td>There is no vaccine for HCV.</td>
<td>There is no vaccine for HIV.</td>
</tr>
<tr>
<td></td>
<td>95% of adults infected with HBV naturally clear the virus and become immune for life.</td>
<td>25-45% of adults infected with HCV clear the virus naturally, but do not become immune.</td>
<td>HIV infection cannot be cleared by the body and infection is for life.</td>
</tr>
<tr>
<td><strong>Transmission</strong></td>
<td>Blood-to-blood contact: Injecting equipment, needle-stick injury, open wounds, tattooing and body piercing equipment. Sexual contact (unprotected anal and vaginal sex). Mother to baby. Infected blood products (all blood screened for hepatitis B in Australia since 1970s). Note: vaccination prevents HBV transmission. HBV is not spread through spitting or saliva exchange. Bites that break the skin and draw blood are very low risk.</td>
<td>Blood-to-blood contact: Injecting equipment, needle-stick injury, open wounds, tattooing and body piercing equipment. Not considered sexually transmitted unless blood contact occurs. Mother to baby. Infected blood products (all blood screened for hepatitis C in Australia since 1990).</td>
<td>Blood-to-blood contact: Injecting equipment, needle-stick injury, open wounds, tattooing and body piercing equipment. Sexual contact (unprotected anal and vaginal sex). Mother to baby. Infected blood products (all blood screened for HIV in Australia since 1985).</td>

<td>A few people will be unwell after infection (called acute hepatitis C). However, most people have no symptoms until they have advanced liver disease. Early signs and symptoms may include:</td>
<td>Early signs and symptoms may include: flu-like illness, rash, fever. After this there may be no signs or symptoms until the infection is advanced. HIV damages the immune system. If left untreated, HIV can progress to acquired immune deficiency syndrome (AIDS).</td>
</tr>
<tr>
<td><strong>Treatment</strong></td>
<td>Long-term antiviral treatment is available for Chronic hepatitis B (CHB) to prevent further liver damage. CHB is hepatitis B infection that lasts for longer than 6 months. Not everyone with CHB needs treatment. Treatment rarely cures CHB, but it does reduce virus in the blood and liver damage and prevents transmission.</td>
<td>Antiviral treatment is available that will usually clear (cure) HCV infection, prevent further liver damage, and stop transmission. New treatment may cure over 90% of HCV infections.</td>
<td>Antiretroviral treatment does not cure HIV but it does stop the virus reproducing and reduces damage to the immune system and progression to AIDS. Treatment significantly reduces the virus in the blood and prevents transmission. On treatment, most people with HIV can now expect to live a normal lifespan.</td>
</tr>
<tr>
<td><strong>Survival of the virus outside the body</strong></td>
<td>Up to 7 days</td>
<td>At least 16 hours at room temperature but not longer than 4 days</td>
<td>From just a few hours up to 7 days depending on conditions such as the type and volume of body fluid the virus is in, the volume of virus in the body fluid, temperature, humidity.</td>
</tr>
</tbody>
</table>

---

You cannot get hepatitis B, hepatitis C or HIV by:
- casual physical contact including hugging, kissing and shaking hands
- coughing or sneezing
- contact with faeces or urine
- saliva on a uniform, or on unbroken skin
- using the same shower, toilet or laundry facilities
- sharing food or drink, plates, cutlery and glasses
- eating food prepared by someone living with a blood-borne virus infection
Police and Blood-Borne Viruses (BBVs)

Risk Assessments

Police are far less likely to have a blood-borne virus exposure than emergency service workers or hospital workers. When exposures do occur, they tend to be less serious. However, after any exposure, it is important that the risk of infection is assessed by a qualified health professional.

The risk of getting a blood-borne virus infection

Usually the source of an exposure is not known e.g. a needle-stick injury from a discarded needle and syringe.

There are many factors that determine the risk of infection. It depends on how the person has been exposed to the virus, the type of virus, how much of the virus the person with the infection (the source) has in their body and, for hepatitis B, the immune status of the exposed person.

This risk is based on the incidence of each virus in the community and the following equation:

\[
\text{Risk of transmission} = \text{risk of source having a BBV} \times \text{risk per exposure}
\]

The following advice is general. If required, it is important to get advice about the risk of infection from a qualified health professional after contact with blood or body fluids. Refer to your local policies and procedures for advice on what to do in case of a possible exposure.

Table 2 shows the estimated risk of infection by a range of exposures from a person who is known to have a blood-borne virus.

* HBV source status not relevant when officer is fully vaccinated and immune  
** HIV source status may not be relevant when source is on treatment and viral load is suppressed.

The source (if known) has a right to privacy, and their BBV status cannot be disclosed without their consent. A person also has the right not to disclose their own BBV status, and even if they do, it may not be reliable because their health status may have changed since their last test.

Police Officers should not delay in having a risk assessment from a qualified health professional even if disease testing orders are available. If the health professional determines there is a risk of infection best practice in this setting is to seek consent from the source before testing for blood borne viruses. If blood test results are negative in the source, it does not always mean there is no risk of infection. The person may be still in the ‘window-period’ and potentially infectious. The ‘window period’ is the period of time after infection and before the virus may be detected in the person’s blood.

Best practice is that Officers should not delay having a risk assessment from a qualified health professional for any possible exposure. Waiting for the Source’s test results is not necessary and may delay treatments which need to begin as soon as possible.
Prevention, Standard Precautions and Infection Control in a Policing Setting

The next section shows how Officers can protect themselves from exposure to blood-borne viruses.

Prevention by Vaccination

All Officers should be vaccinated against hepatitis B to protect themselves and others.

Vaccination involves three doses of HBV vaccine over six months. A blood test after completion of the vaccination course can confirm immunity.

All Officers are required to show proof of immunity and/or age appropriate vaccination. Applicants may be tested by the police service as part of the recruitment process.

Standard Precautions and Infection Control

Standard Precautions ensure a high level of protection against blood-borne viruses and other infections.

The rule is: treat all blood and body fluids as infectious

Standard precautions should be taken by everyone who has contact with blood, body fluids, broken skin, and eye, nose or mouth surfaces. Standard precautions are just that; standard for all, not just for those suspected or known to have a BBV.

Following standardised infection-control procedures helps protect Officers from occupational exposure to all blood-borne viruses and other infections. These procedures are:

a) Personal protective equipment (gloves and protective clothing)

- Wear personal protective equipment (gloves and protective clothing)
- Wear disposable gloves in situations where you may be in contact with blood or body fluids. The gloves do not have to be sterile.
- Wear personal protective equipment, such as eyewear and face shields, when there is any chance of being splashed or sprayed in the face.

b) Avoid exposure to broken skin

- Cover your own open wounds/cuts/blisters no matter how small, with waterproof dressings. This is especially important for injuries to your hands.
- Avoid creams that may cause dermatitis or broken skin.
- Avoid contact with a person’s mouth or teeth, open wounds, etc.

c) Safely handle and dispose of sharp objects such as needles, blades and broken glass

- Hold a syringe by the barrel with a gloved hand.
- Never touch the needle.
- Do not re-cap, bend or break the needle.
- Do not remove a needle from the barrel.
- Never move your hands across your body when handling a sharp.
- Dispose of the sharp in a sharps container (a yellow, rigid walled container displaying the biohazard label and symbol).
- When in the field, dispose of a sharp in a thick plastic drink bottle if a sharps container is not available.
- Take the sharps container to the sharp rather than carrying the sharp around.

d) Prevention of needle-stick and sharps injuries when doing searches

- Take a slow systematic approach to searching.
- Do not slide your hand when searching.
- Do not put your hands in places you cannot see into e.g. bags, cupboards, drawers, under a mattress
- Use tools, instead of your hand, to examine hard-to-access areas.
- Empty the contents of bags and containers onto a flat surface for inspection, rather than putting your hands inside.
- Use mirrors and adequate lighting (including torches) to assist with the search.

e) Environmental blood and body-substance spills

Where it is required:

- Deal with blood and body-substance spills as soon as possible.
- A ‘spills kit’ should be readily available for blood spills. A spills kit should contain PVC household rubber or disposable latex gloves, plastic apron, eye protection, face masks, cleaning agents, disposable absorbent material (e.g. paper towels), a leak-proof waste bag, mop and a bucket with a lid.
- Wear personal protective equipment (gloves, goggles, waterproof apron).
- Mop up spills, including those on clothing, with paper towels and dispose of towels immediately. Change contaminated clothing as soon as possible.
- Wash spills on hard surfaces with detergent and cold water, and allow to air dry.
- Wash furnishings such as chairs and mattresses with cold water and detergent and allow to dry.
- Wash soiled uniforms and other clothing separately in cold water. Washing in hot water will cause the bloodstain to clot and stay on the clothes. Wash leather goods (belts, shoes) with soap and cold water.
Environmental Risk Assessment

Police work can be very unpredictable in the field. However, it is important that, where possible, all appropriate measures are taken to ensure safety. Safe Work Australia advises the following:

- **Hazard identification:** Identify activities in the workplace and in the field that may put Officers or members of the public at risk of infection with blood-borne viruses.
- **Risk assessment:** Evaluate risk to Officers from blood or body fluid exposures. Risk assessments need to be conducted by qualified health professionals, consistently monitored, reviewed and evaluated to take into account specific duty.
- **Risk control:** The most important step in controlling risks involves eliminating them as far as possible or if not, then minimising the risks so far as is reasonably practicable.

Officers must comply with all OH&S policies and procedures including:

1) Limiting exposure to sharps
2) Maintaining a safe working environment
3) Complying with standard infection control precautions
4) Following policies and procedures in case of accidental exposure.

Managing exposures to blood and body fluids

It is important to act immediately:

- Wash exposed skin with soap and water. Use an alcohol-based hand rub if no water is available. Do not suck or squeeze the wound.
- If the eyes have been exposed, thoroughly rinse the eyes with tap water or saline while open. Flush from the inside corner outwards.
- Remove contact lenses before rinsing the eyes. Clean contact lenses before reinserting.
- If the mouth has been exposed, spit, then rinse the mouth with water and spit again.
- Seek advice from a qualified health professional, including a BBV risk assessment, promptly. If available, call the designated hotline for your service (contact details for each state and territory can be found on page 7).

Officers may get advice from a health professional of their choice. It is preferable to seek advice from a qualified health professional experienced in the management of BBV exposures. Officers should also seek advice from a qualified health professional for tetanus exposure and vaccination. Follow-up will be needed after a needle-stick injury. Officers must also report the incident according to the local policies and procedures.

Whilst a BBV health risk assessment is important, in fact occupational BBV transmission is rare and no further action may be needed.

Testing and Avoiding Transmission

Officers who have had a blood-borne virus exposure may be tested for infection as part of the risk assessment. While waiting for test results it is important not to place others at risk:

- Practice safer sex, i.e. use a condom for vaginal or anal intercourse
- Cover any sores, cuts or abrasions and attend to any household blood spills yourself
- Do not share personal items such as razors and toothbrushes
- Do not share injecting equipment and dispose of used injecting equipment safely
- Do not donate blood or organs
- Seek advice from a qualified health professional if you are, or are planning to become pregnant or are breast feeding.

A possible blood-borne virus exposure should not affect an Officer’s ability to perform normal duties. Officers should speak to the qualified health professional conducting the risk assessment if they are concerned about returning to work.

For hepatitis B, no further testing is required if you are immune.

For hepatitis C, blood tests are recommended at 12 and 24 weeks after the exposure. A negative test result at 24 weeks means you did not contract hepatitis C. If earlier confirmation of possible infection is required, a different test (HCV RNA) can be performed after 2-4 weeks from the time of possible exposure.

For HIV, you will usually be offered HIV tests at six and 12 weeks after the exposure. A negative blood test 12 weeks after the exposure means you did not contract HIV.

Post Exposure Prophylaxis (PEP)

PEP is medication taken after exposure to hepatitis B or HIV to reduce the risk of infection. A health professional will assess the risk of HIV or hepatitis B infection to determine the need for PEP.

For hepatitis B, PEP is not required if you have been fully vaccinated and are immune.

PEP for HIV is usually only offered for high-risk exposures. There may be major side-effects of the medication so it is not routinely given to everyone with a possible exposure. If PEP is recommended, it must begin within 72 hours, but preferably within 24 hours, of the exposure.

PEP is not available for hepatitis C. But it is still important that a qualified health professional assesses the risk of infection and follow-up arrangements.

For further information see the National PEP Guidelines.

Providing Support

Experiencing a blood-borne virus exposure can be stressful. Your health professional and your designated employee assistance services are available to provide support during this period (see the ‘Helplines for Police’ table, page 7).

Discrimination

Hepatitis B, Hepatitis C and HIV are highly stigmatised conditions. Many people living with these viruses experience discrimination. Policies and practices that protect people’s privacy and confidentiality are important. Legislation prohibits discrimination against people with a blood-borne virus. There are also laws protecting people’s health information. Discrimination happens because of fear and misunderstanding. Having good quality
information about blood-borne viruses and how they are spread removes the fear about transmission and so reduces discrimination.

There is no need to isolate or deal with a person any differently because he or she is known to have, or is suspected of having, a blood-borne virus infection. Standard precautions are protective and should be used with all people. A person's suspected blood-borne virus status or sexual orientation must not be recorded in police records unless it is directly relevant to a crime.

There may be occasions where Officers learn of a person's blood-borne virus status. In this case, the information is strictly confidential. It is essential that every effort is made to protect the privacy rights of the person concerned. In the case of a person in custody disclosing their BBV status, Officers should follow local policies and procedures about arrangements for providing access to medication and medical care.

**Police Officers with a BBV**

All Officers should be vaccinated against hepatitis B. It is recommended that Officers know their own status with regard to blood-borne viruses. Knowing your status means you can get the right health care for yourself. All Officers should adhere to standard precautions to avoid transmitting blood-borne viruses in the workplace. 7 It should be considered an ethical duty to avoid placing co-workers or the public at risk.

Officers are not required to tell their employer about their blood-borne virus status. Employers must not discriminate against their employees on the basis of their BBV status. Officers who have a blood-borne virus infection should consult a suitably qualified health professional to assess their risk of infection. Standard precautions are protective and should be used with all people. A person’s suspected blood-borne virus status or sexual orientation must not be recorded in police records unless it is directly relevant to a crime.

There may be occasions where Officers learn of a person's blood-borne virus status. In this case, the information is strictly confidential. It is essential that every effort is made to protect the privacy rights of the person concerned. In the case of a person in custody disclosing their BBV status, Officers should follow local policies and procedures about arrangements for providing access to medication and medical care.

The National Antidiscrimination Gateway provides a snapshot of each antidiscrimination system including information about the grounds and areas of public life on which a complaint can be made in each jurisdiction. Individuals and businesses can also find contact details for each anti-discrimination commission, anti-discrimination board or human rights commission, through this Gateway, http://www.ag.gov.au/RightsAndProtections/HumanRights/Pages/default.aspx

National Guidelines for Post-Exposure Prophylaxis after Non-occupational Exposure to HIV

These guidelines outline the management of individuals who have been exposed (or suspected they have been exposed) to HIV in the non-occupational setting. The guidelines are available at: http://www.ashm.org.au/Documents/NPEPPEPGuidelinesDec2013.pdf

Safe Work Australia

Safe Work Australia (formerly known as the National Occupational Health and Safety Commission) began operating in 2009 as an independent statutory agency with primary responsibility to improve occupational health and safety and workers’ compensation arrangements across Australia. Police can access the National Code of Practice for the Control of Work-related Exposure to Hepatitis and HIV (blood-borne) Viruses by visiting www.safeworkaustralia.gov.au

Further resources and support information is available from the following organisations:
